

CATALYST^{CR}

Document Review and Litigation Support Platform

With digital content exploding, clients are looking for new ways to manage litigation, electronic discovery, and large volumes of electronic documents. **CATALYST^{CR}** provides a hosted search and review platform for electronic discovery, litigation support, due diligence, compliance and other document-intensive matters. It offers a powerful but simple-to-use interface, lightning-fast search, and no-limits scalability.

Internet Levels of Scalability

Built on a grid of servers running the FAST search engine, CR provides sub-second response times, even for massively complex searches against large volumes of documents. In certified testing, CR routinely delivered sub-second responses for complex searches of up to 750 terms—field, text, proximity and ranges—against 15 million documents.

The screenshot shows the CatalystRepository web interface in a browser window. The page title is "John Tredennick - Demo" and the date is "Tuesday, December 3, 2008". The search criteria are displayed as a complex Boolean query involving multiple document control numbers and fields like BegControl, endControl, and DocDate. The search results are shown in a table with columns for Open, BegControl, EndControl, Date, Author Recipient, Description, and Issue Folder. The table lists 10 results, including documents from Microsoft, Enron, and various other sources. The interface also shows a search bar, navigation links, and a sidebar with collection filters.

Open	BegControl	EndControl	Date	Author Recipient	Description	Issue Folder

Sub-Second Search Times Even for Complex Queries

Catalyst's simple but powerful interface makes finding, reviewing and producing documents easy for the entire legal team. Delivered On Demand over the web, the system runs in a browser and does not require software downloads or special connections through Citrix or Terminal Services. It can be operational in minutes, with no expensive software to purchase, install or manage.

The Features You Need

CR provides the Litigation specific features legal professionals need to search, review, redact and produce documents for complex litigation.

- **Search:** Locate documents quickly with flexible keyword, full-text, date-range, bates-range, proximity and concept searches. No practical limit on search size or number of operators.
Review: Customized review pages optimized for speed and efficiency. Batch coding allows reviewers to code parent/child documents together or mark entire folders.
- **Redaction:** Instant, web-based redaction—no client to download or special connection required. Supports custom labels and multiple redaction sets. View transparencies for QA review.
- **Print:** Print reports in a variety of formats including Excel, Word, HTML, XML and several delimited formats. Print documents in PDF with custom headers and footers, watermarks and separator sheets containing fielded information from the database.
- **Produce:** Prepare productions in any format with labels, watermarks and bates numbers. Can be delivered over the Web (secure FTP) or on CD, DVD or other magnetic media.
Native Formats

CR allows you to review email formats (MSG and EML) without need for advance conversion or special client software. As part of the upload process, we convert other native files (including Office documents and about 300 other file types) into HTML for rapid review. You can also download and view the original files in their native format for analysis or closer inspection. We also support PDF and TIFF for images and offer streaming to the browser for both.

Joint Defense Groups

CR regularly supports multi-party litigation, joint plaintiff or defense groups, or cases involving opposing parties. We can provide private fields and document sub-collections for every party. Private fields allow each group to annotate documents securely with their comments. Document collections are secured by user groups for separate search/review.

Foreign Language Support

CR supports over 70 foreign languages including multi-byte languages like Kanji and Mandarin. We provide extended support for five major languages: French, German, Spanish, Japanese and Chinese. Extended support includes lemitization (word stemming), place and name extraction, and document vectors for concept search.
